

4T: Tech Transfer Think Tank

22 May 2015

# Policy Levers in Innovation: A View from “Across the Pond”

Stuart Graham, JD, PhD  
*Associate Professor of  
Business Strategy*

---

## Some economics behind tech transfer

- Specialization
  - Ricardo; Smith – “each to his comparative advantage, then trade to maximize economic efficiency”
- Markets for technology
  - Arora, Fosfuri, Gambardella (2004)
- The role for IP (patents)
  - Create incentives to invest today, with promise of recouping R&D investments in the future, and
  - Provide a platform for trading, and licensing: Creating a market mechanisms allowing for specialization

---

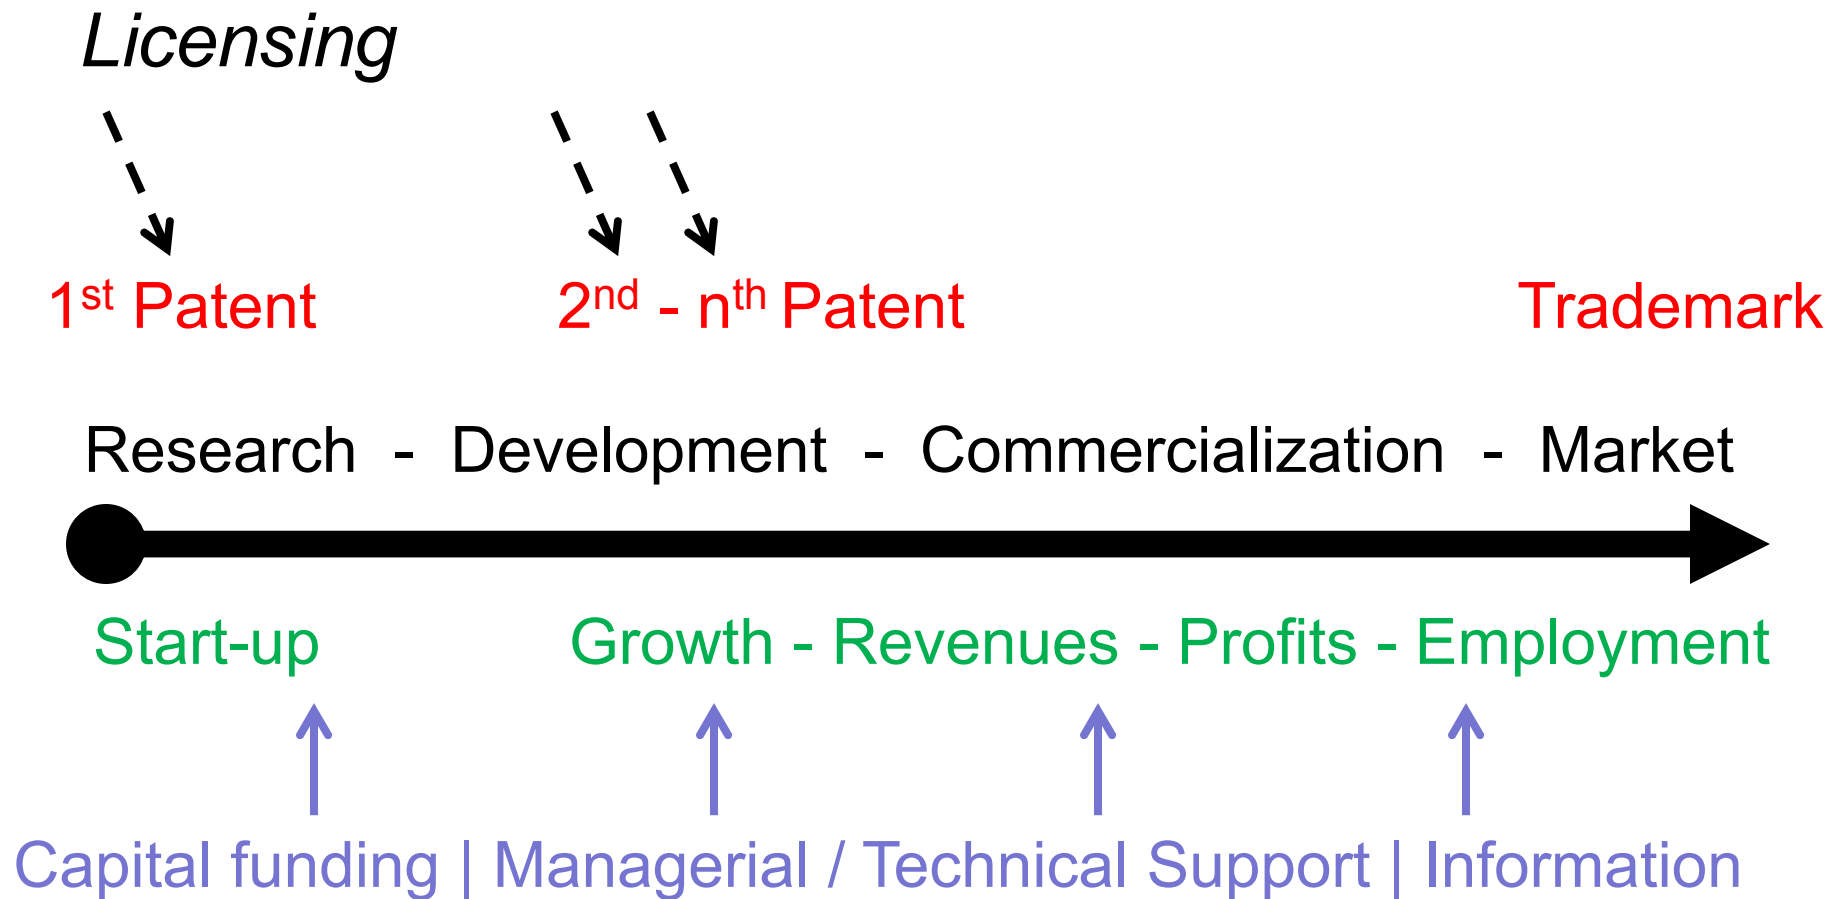

# Invention and Innovation

- Josef Schumpeter, 1930s
  - Invention and Innovation different phenomena
    - ***Invention*** is the creative spark, but
    - ***Innovation*** is the commercialization process, starting with an *Invention* but conducting the development, making investments in time, resources, money, and successfully marketing the resulting product or service
  - Watt, Boulton and 20 years delay...

---

# Schematic of the innovation process

---

# The Role of the University in Innovation

- I am going to describe the U.S. system
  - *Drunk man and the lightpost*
- Comparative analysis can bring clarity, but
- Our answer must include an understanding of *National Innovation Systems (NIS)*.
  - Generally, NIS defined as
    - The institutions (formal and informal) and actors that affect the creation, development, and diffusion of innovation in a society

---

## Reported importance to U.S. Industry R&D: Patents & Licenses from Public Entities

| Information source       | % rating it as "very" or "moderately" important for industrial R&D |
|--------------------------|--------------------------------------------------------------------|
|                          |                                                                    |
| Publications & reports   | 41.2%                                                              |
| Informal Interaction     | 35.6                                                               |
| Meetings & conferences   | 35.1                                                               |
| Consulting               | 31.8                                                               |
| Contract research        | 20.9                                                               |
| Recent hires             | 19.6                                                               |
| Cooperative R&D projects | 17.9                                                               |
| Patents                  | 17.5                                                               |
| Licenses                 | 9.5                                                                |
| Personnel exchange       | 5.8                                                                |

---

## Three primary bases

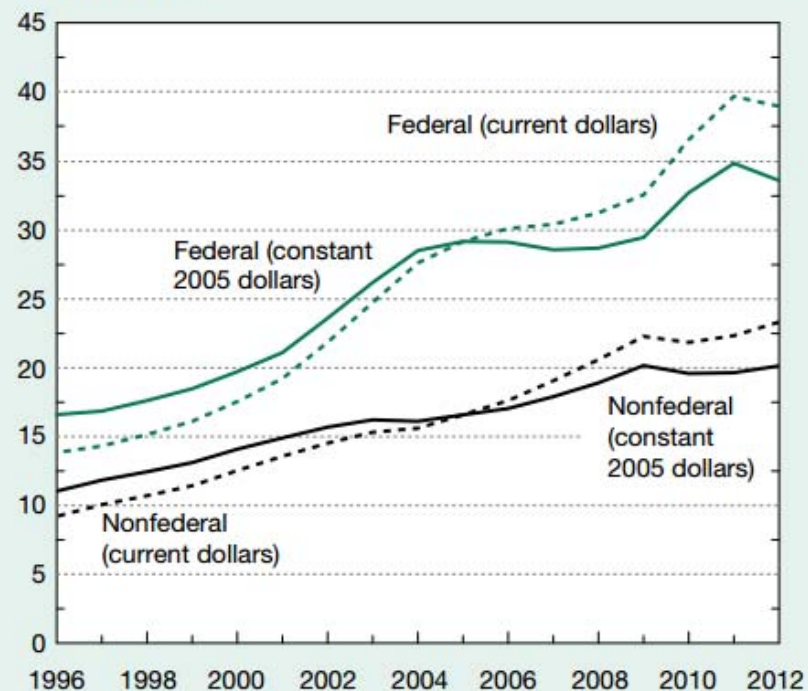

- Investments in basic R&D
  - Government – and increasingly Industry – funding
- Technology transfer offices in universities
  - Patenting, and licensing
- Successful commercialization
  - Licensing, new company start-ups / spin-outs, university-industry collaboration

**Figure 5-1**  
**Federal and nonfederal academic S&E R&D expenditures: FYs 1996–2012**

Billions of dollars

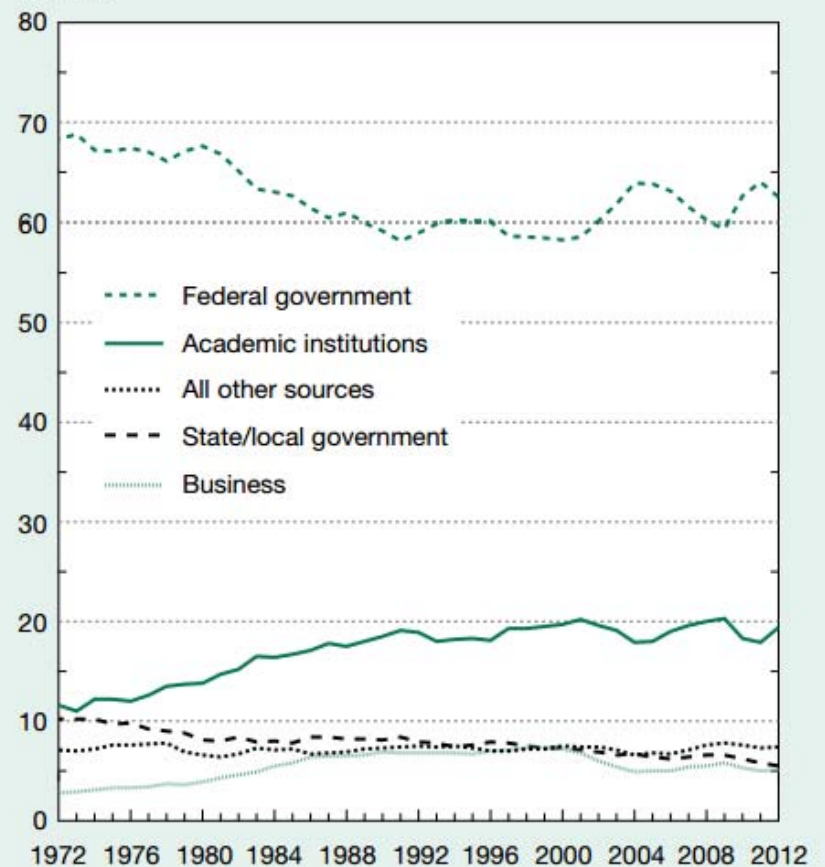

NOTES: Data include expenditures for S&E R&D. Gross domestic product implicit price deflators were used to convert current dollars to constant 2005 dollars.

*Science and Engineering Indicators 2014*

Figure 5-36  
**U.S. academic patents, by technology area: Selected 5-year averages, 1993–2012**

NOTES: Data include institutions affiliated with academic institutions (e.g., university and alumni organizations, foundations, and university associations). Universities vary in how patents are assigned (e.g., to boards of regents, individual campuses, or entities with or without affiliation with the university). The Patent Board™ technology areas constitute an application-oriented classification system that maps the thousands of International Patent Classes (IPCs) at the main group level into 1 of 35 technology areas. If a patent has more than one IPC, only the primary IPC is considered in mapping.

SOURCES: National Science Foundation, National Center for Science and Engineering Statistics, and The Patent Board,™ special tabulations (2013) from U.S. Patent and Trademark Office (USPTO), Patent Grant Bibliographic Data. See appendix table 5-63.

---

## Patenting U.S. federally-funded research

- Prior to 1980, university patenting rate was low
    - But, important inventions found their way into the patenting system, such as Cohen-Boyer PCR, 1970s
  - Bayh-Dole Act (1980)
    - Loosened regulations on university patenting
    - Subsequent growth in university tech transfer offices (TTOs), university patenting, and university licensing
  - Patenting rules in the U.S.
    - Generally, new emerging technologies are patentable
      - Biotechnology (1980); Software (1986)
    - Patent fee discounts: 50% small entity; 75% universities
-

## LAUNCHING AND BUILDING TECHNOLOGY COMPANIES

ATDC by the numbers

### Georgia Tech's Advanced Technology Development Center is a Startup Powerhouse

When he enrolled as a Ph.D. student in Georgia Tech's College of Computing five years ago, Vijay Balasubramaniyan never expected to become the CEO of one of Atlanta's hottest young information security companies.

Since 1986, ATDC companies attracted **MORE THAN \$2 billion** IN OUTSIDE CAPITAL

unique he dev  
ted \$12 million  
e capital firms  
ation's five larg  
ties that are  
g staff and da  
computer scr  
omers.

Since 1987, ATDC's 150 graduate companies have generated **MORE THAN \$12 billion** IN REVENUE

ip Security.  
tz, one of  
g the top  
n as  
est Coast.  
alls going

In 2013, ATDC companies created a combined total of **MORE THAN \$1 billion** IN REVENUE

In 2013, ATDC companies attracted **MORE THAN \$50 million** IN OUTSIDE CAPITAL

From an office in Georgia Tech's Technology Center

the 1980s

# Summary

- In the U.S., the university is an integral part of our National Innovation System
    - It generates *Invention*, and takes an active role in *Innovation*
  - How do the three bases work?
    - Investments in basic R&D
      - Prime the pump – fuel the engine
    - Technology transfer offices in universities
      - Selection in TTO to patent, based on likely successes
    - Successful commercialization
      - Further selection from industry, based on likely commercial success
  - Outcomes: Efficient specialization, and royalties flow back to the university to invest in more R&D
    - And public receives a steady stream of innovation, improving lives
-
